

TPG1 15 Second Timer

The TPG1 is a versatile timer relay which provides a simple solution to a variety of requirements - particularly in access control for timed unlocking. The unit is complete with a changeover relay, and triggers via a positive or negative pulse. There is the option to install a contact to inform the unit when the door is closed, thus triggering the auto-relock function which prevents the door remaining unlocked. Terminal marked "REED".

* Reed: If a door contact is used, once the relay timer has started the timer will reset when it sees the door open and close. This feature prevents the door being insecure for the remainder of the timer period once an entry has been made.
